Overview

- 1 Cloud-Native Edge Architecture
- 2 Requirements and Challenges
- 3 Cloud-Native Solutions

Building an Edge Architecture

Cloud Native Operation for both 5G Infrastructure and Enterprise applications

What's Cloud Native?

Cloud Native Software

1. Highly distributed
2. Consistent change
3. Operate in consistent changing environment

Could Native Operation

1. Composable and connected apps to enable high level service construct
2. API first programmability to build, deploy, operate and secure
3. Abstract and hide the complexity of infrastructure and operations from modern apps

What matters?

Latency

Workload

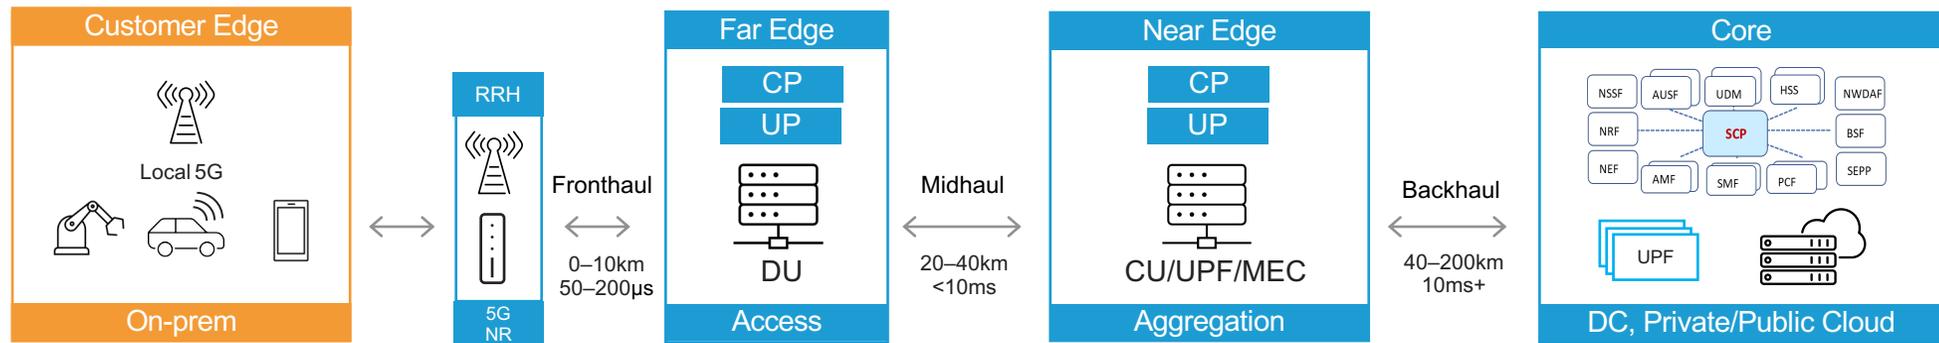

Network Stack

Fleet Mgmt.

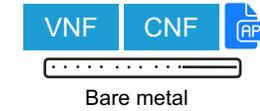

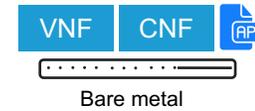

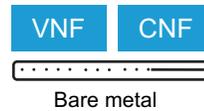

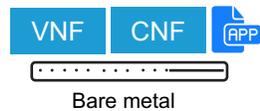

E2E
orchestration

Operation
Model

Cloud Native Operation for both 5G Infrastructure and Enterprise applications

Workload Type

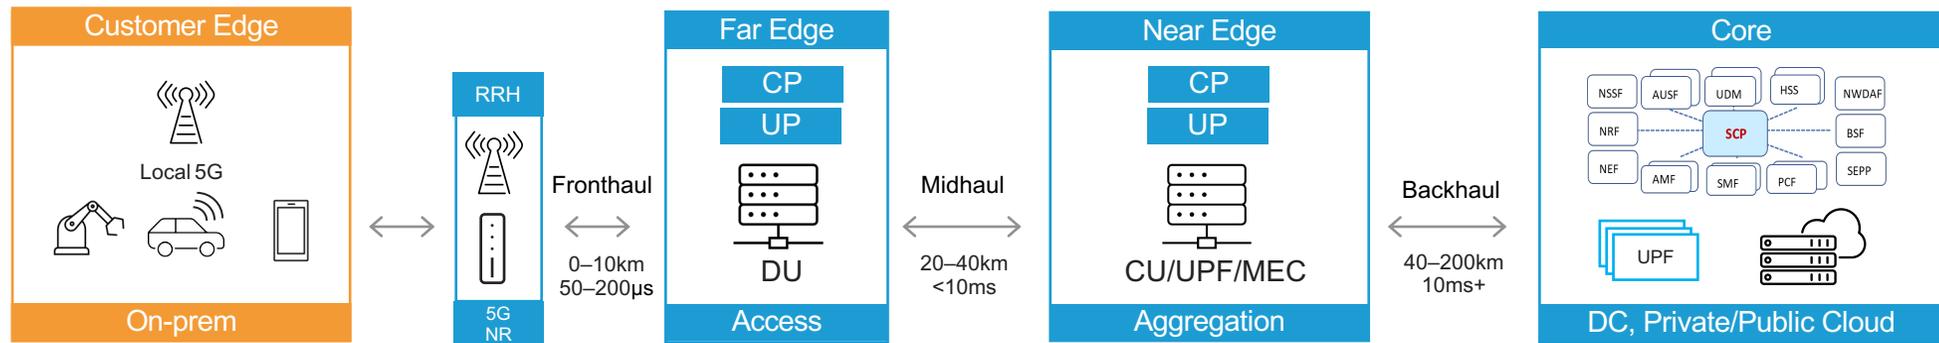

- Support all Types of Workloads**
- Container, VM, Bare metal
 - Stateless and Stateful Apps
 - Distributed Data Store for Stateful apps

Workload type

1. Bare metal, VM and Container based workload will co-exist for lifelong by Telco providers—this requires the support to orchestrate Bare metal, VM and Container at large scale in a distributed infrastructure altogether
2. It needs to orchestrate both the infrastructure network functions (VNF/CNF) and the atop applications to move up the value chain
3. While adopting scalable modern web design via stateless REST API, there are a lot of stateful applications in Telco world that need to be supported

Cloud Native Operation for both 5G Infrastructure and Enterprise applications

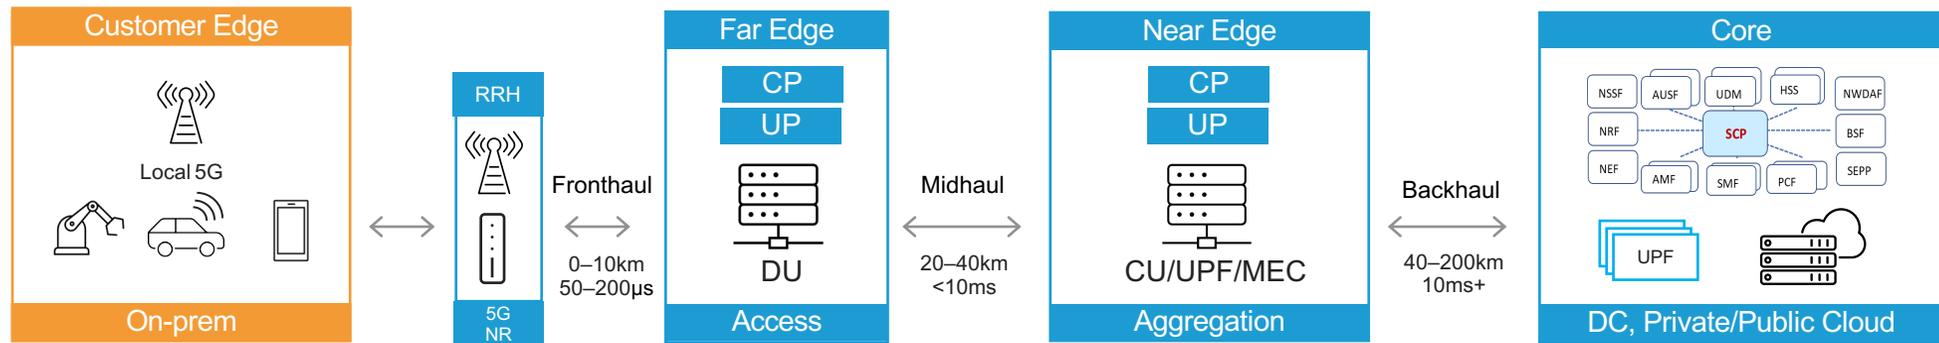

Workload Type	VNF CNF APP Bare metal	VNF CNF Bare metal	VNF CNF APP Bare metal	VNF CNF APP Bare metal	Support all Types of Workloads <ul style="list-style-type: none"> • Container, VM, Bare metal • Stateless and Stateful Apps • Distributed Data Store for Stateful apps
OS Requirement	RT Near RT Non RT	RT Near RT	Non RT	Non RT	OS support for different use cases <ul style="list-style-type: none"> • RTOS • Near RTOS • GPOS

OS requirements per workload types

1. Various workloads impose different requirements for response time
2. Network functions at Far Edge and Customer Edge would demand more deterministic response time, which requires the support of RTOS/near RTOS

Cloud Native Operation for both 5G Infrastructure and Enterprise applications

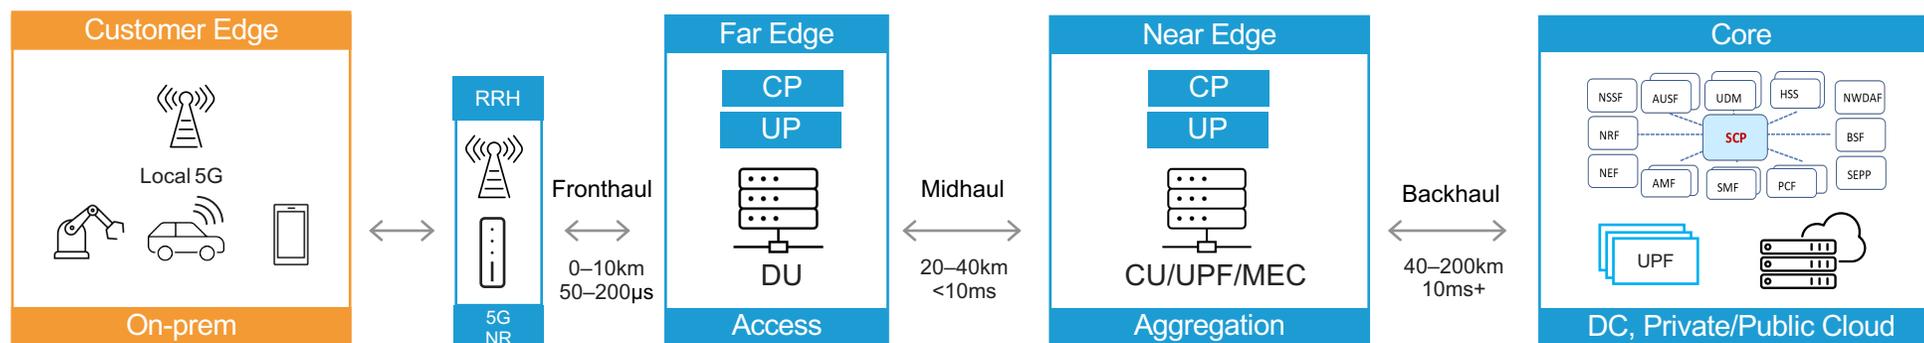

Workload Type	VNF CNF APP Bare metal	VNF CNF Bare metal	VNF CNF APP Bare metal	VNF CNF APP Bare metal	Support all Types of Workloads <ul style="list-style-type: none"> • Container, VM, Bare metal • Stateless and Stateful Apps • Distributed Data Store for Stateful apps OS support for different use cases <ul style="list-style-type: none"> • RTOS • Near RTOS • GPOS LCM via Fleet management <ul style="list-style-type: none"> • Apps • Firmware, OS • ZTP, ZTO
OS Requirement	RT Near RT Non RT	RT Near RT	Non RT	Non RT	
Fleet Management	APP APP OS	APP APP OS	APP APP OS	APP APP OS	

Fleet management for both Infra and Apps LCM

1. It requires Zero-Touch to Low-Touch to deploy, operate and secure thousands of sites and/or apps at large scale in a distributed manner under a single pane of glass for end-to-end management
2. It requires upgrade, downgrade, rollback for OS, Firmware, applications via cloud native operation model like GitOps for A/B testing, Blue/Green deployment, config mgmt., certificate rotation, auto-scale, AuthN/AuthZ, IAM, etc.
3. It requires simplified management to tag/label sites with declarative configuration, which can select the group of sites with affinity in the business context for the same operation. This has to be site agnostic, no matter whether the target site is sitting in customer edge, network edge, private data center/cloud, or public cloud providers

Cloud Native Operation for both 5G Infrastructure and Enterprise applications

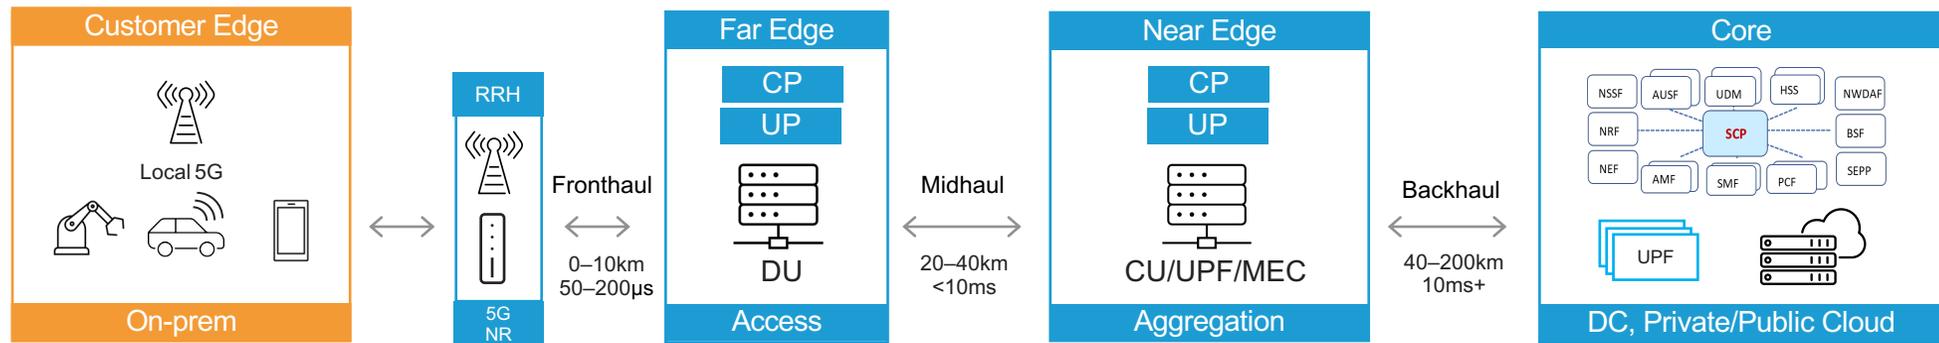

Workload Type	VNF CNF APP Bare metal	VNF CNF Bare metal	VNF CNF APP Bare metal	VNF CNF APP Bare metal	Support all Types of Workloads <ul style="list-style-type: none"> • Container, VM, Bare metal • Stateless and Stateful Apps • Distributed Data Store for Stateful apps
OS Requirement	RT Near RT Non RT	RT Near RT	Non RT	Non RT	OS support for different use cases <ul style="list-style-type: none"> • RTOS • Near RTOS • GPOS
Fleet Management	APP APP OS	APP APP OS	APP APP OS	APP APP OS	LCM via Fleet management <ul style="list-style-type: none"> • Apps • Firmware, OS • ZTP, ZTO
Cloud Native Operation					E2E Orchestration <ul style="list-style-type: none"> • Scalable centralized management • Location agnostic

Cloud Native Operation with Centralized Management

1. It requires a scalable centralized orchestration and End to End management for both infrastructure network functions and atop applications
2. The centralized management must be able to support thousands or potentially millions of distributed clusters under one single consumable interface for easy operation
3. It must provide one single operation model with an API centric open architecture to simplify Day-2 operation across all network domains (e.g., on-prem vs. access vs. aggregation vs. core)

Cloud Native Operation for both 5G Infrastructure and Enterprise applications

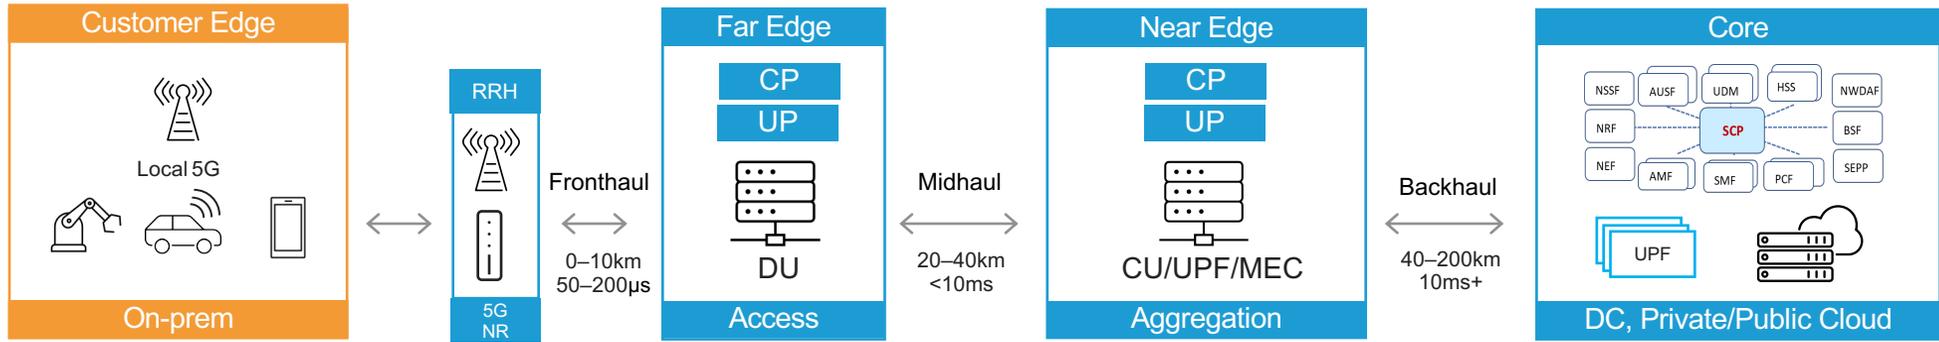

High Performance Network Stack

1. It requires a high-performance network stack for various workloads at different locations between infrastructure workload across Customer Edge, DU, CU, MEC, Core, **AND** Enterprise application workload respectively
2. This requires the network stack to support RTOS/near RTOS for latency sensitivity workload at DU for example, along with GPOS in general everywhere else

Network Stack	Requirements	Requirements	Requirements	Requirements	High Performance Network Stack
	<ul style="list-style-type: none"> • Nomadic Edge & Fixed Edge • Large variety of form factors, I/O, CPU/GPU/FPGA, Wi-Fi/LTE/5G • Cost/Perf sensitive, COTS HW • IPv4 & IPv6 	<ul style="list-style-type: none"> • High performance network stack with Low Latency & High throughput • CPU pinning, NUMA aware scheduling, PCI passthrough, Guest TSC • SR-IOV, Multus, DPDK • GPU/FPGA Acceleration • RT/near-RT OS • IPv4 & IPv6 	<ul style="list-style-type: none"> • Distributed resource allocation • Reliability and mobility • Hybrid cloud applications portability • Security and Data sovereignty • IPv4 & IPv6 • GPU/FPGA acceleration on MEC 	<ul style="list-style-type: none"> • Gi/N6 NF – CGNAT, Gi-FW, DDoS, Secure DNS cache, TCP & Video Optimization, WAF • CDN, Anti-fraud, Anti-bot • Service Mesh, K8s Ingress/Egress, API mgmt • LI, Analytics, Logging • IPv4 & IPv6 	

It requires one operational model

Workload Type	<p>Bare metal</p>	<p>Bare metal</p>	<p>Bare metal</p>	<p>Bare metal</p>	Support all Types of Workloads <ul style="list-style-type: none"> • Container, VM, Bare metal • Stateless and Stateful Apps • Distributed Data Store for Stateful apps
OS Requirement					OS support for different use cases <ul style="list-style-type: none"> • RTOS • Near RTOS • GPOS
Fleet Management					LCM via Fleet management <ul style="list-style-type: none"> • Apps • Firmware, OS • ZTP, ZTO
Network Stack	<div style="border: 1px solid orange; padding: 5px;"> <p>Requirements</p> <ul style="list-style-type: none"> • Nomadic Edge & Fixed Edge • Large variety of form factors, I/O, CPU/GPU/FPGA, Wi-Fi/LTE/5G, • Cost/Perf sensitive, COTS HW • IPv4 & IPv6 </div>	<div style="border: 1px solid blue; padding: 5px;"> <p>Requirements</p> <ul style="list-style-type: none"> • High performance network stack with Low Latency & High throughput • CPU pinning, NUMA aware scheduling, PCI passthrough, Guest TSC • SR-IOV, Multus, DPDK • GPU/FPGA Acceleration • RT/near-RT OS • IPv4 & IPv6 </div>	<div style="border: 1px solid blue; padding: 5px;"> <p>Requirements</p> <ul style="list-style-type: none"> • Distributed resource allocation • Reliability and mobility • Hybrid cloud applications portability • Security and Data sovereignty • IPv4 & IPv6 • GPU/FPGA acceleration on MEC </div>	<div style="border: 1px solid blue; padding: 5px;"> <p>Requirements</p> <ul style="list-style-type: none"> • Gi/N6 NF – CGNAT, Gi-FW, DDoS, Secure DNS cache, TCP & Video Optimization, WAF • CDN, Anti-fraud, Anti-bot • Service Mesh, K8s Ingress/Egress, API mgmt • LI, Analytics, Logging • IPv4 & IPv6 </div>	High Performance Network Stack

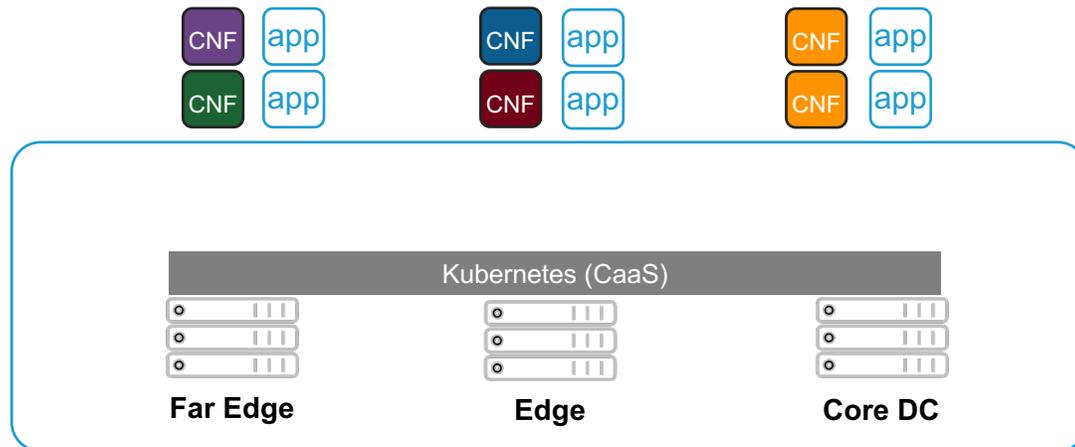

Deployment Challenges

Who owns the cloud-native infrastructure?

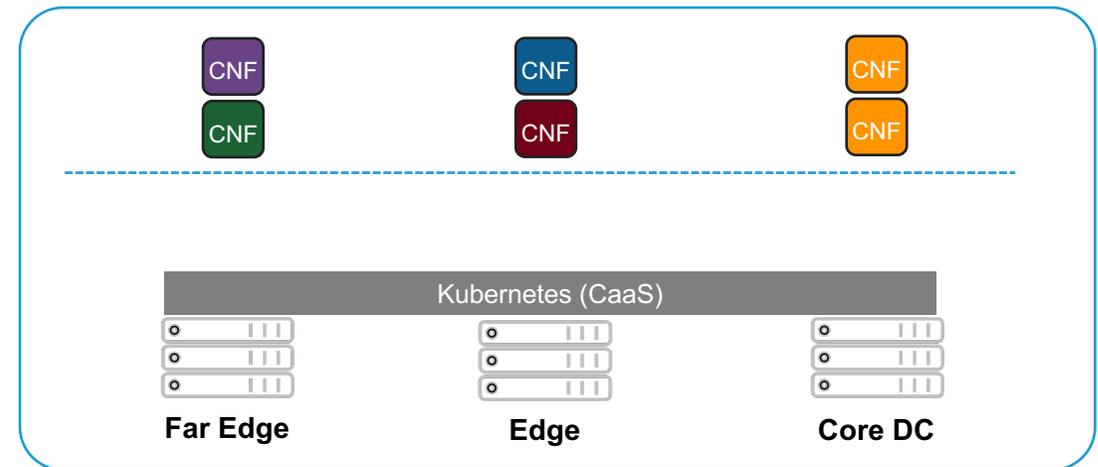

HURDLES SEEN IN SERVICE PROVIDER ORGANISATIONS

Infrastructure / Platform Group

Goals: Consistent architecture across IT and 5G environments supporting multiple use cases

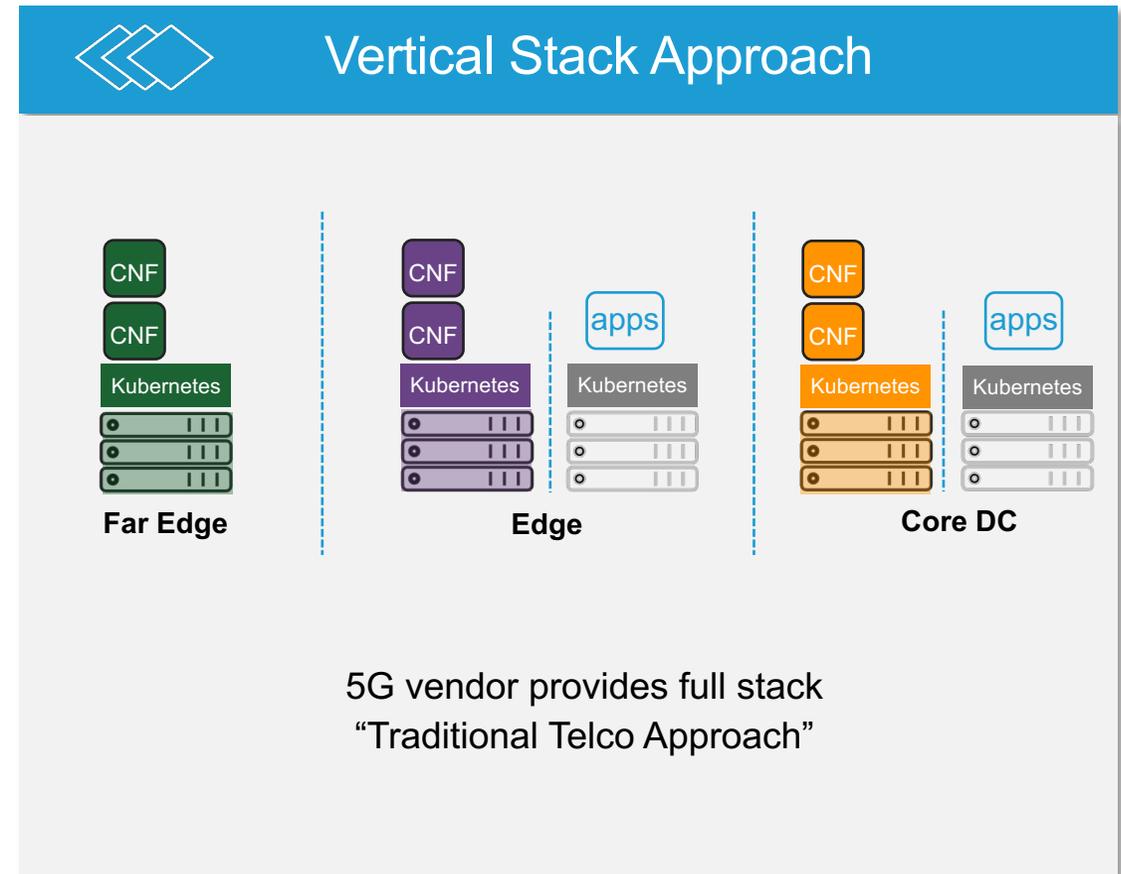

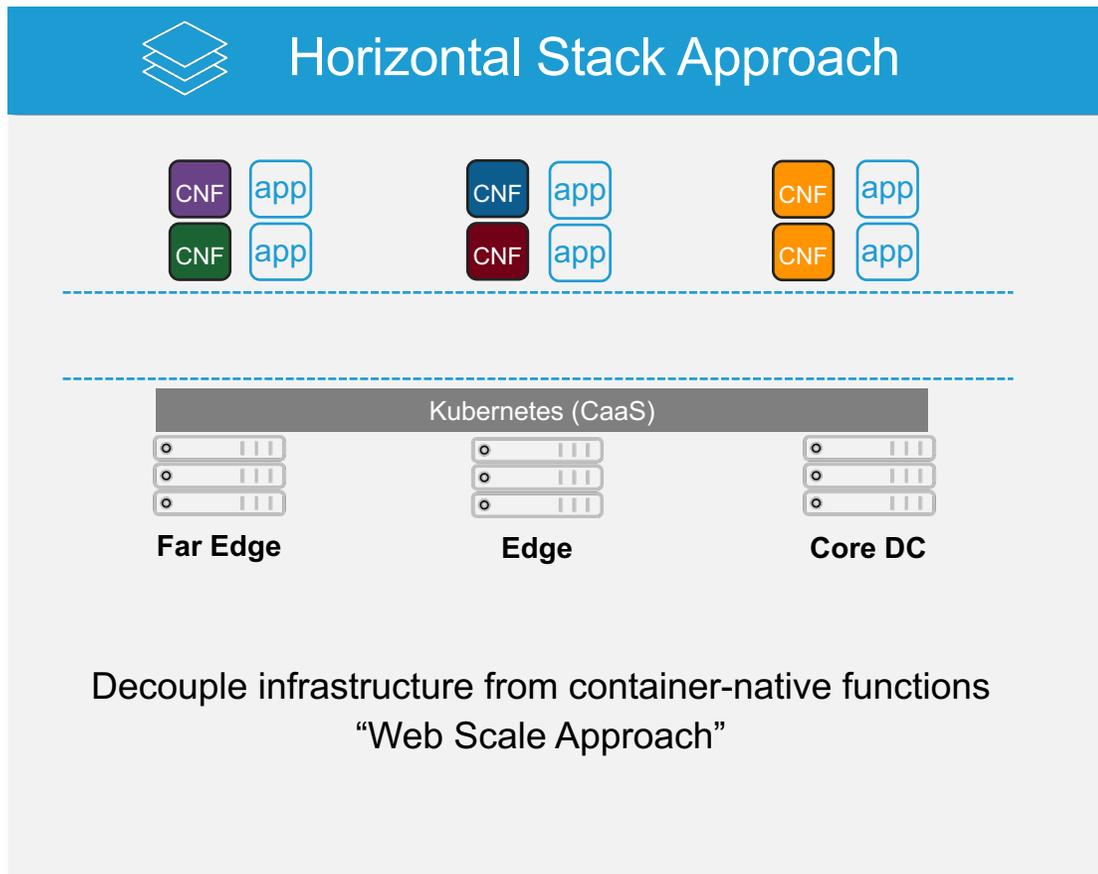

Mobility Group

Goals: Deployment of 5G components without too much focus on IT and enterprise applications

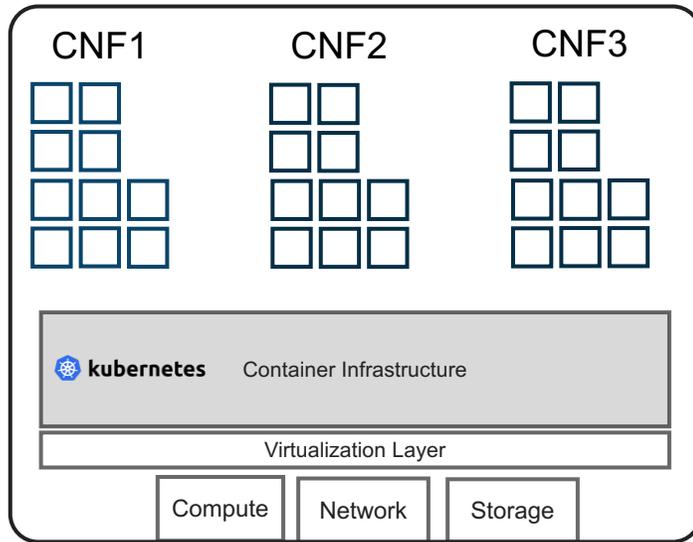

Common infrastructure deployment strategies

TURN-KEY VERSUS BUILD-YOUR-OWN APPROACHES

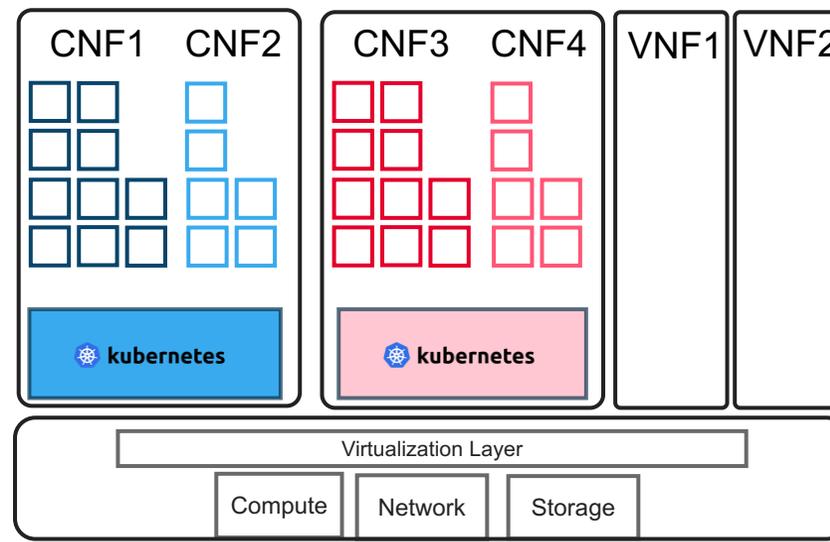

Common CNF deployment strategies

THREE POSSIBLE OPTIONS IN DEPLOYMENT MODELS

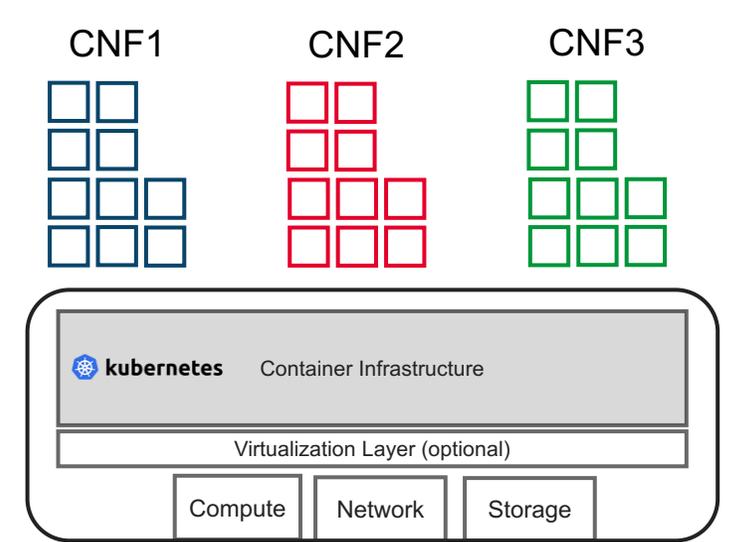

Mode 1

Everything provided by one vendor

Mode 2

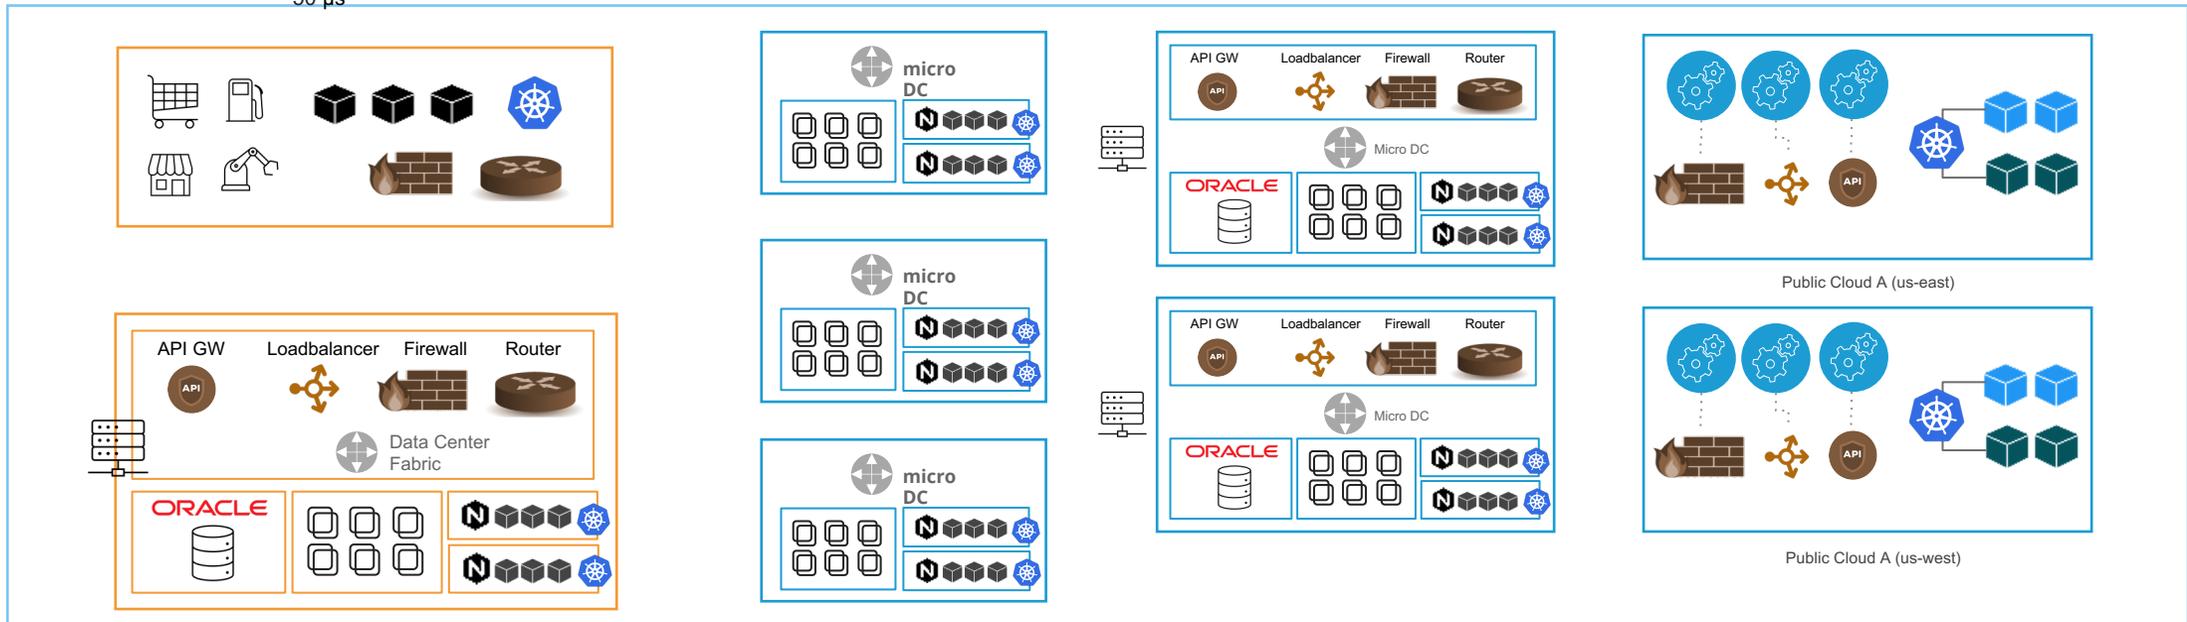

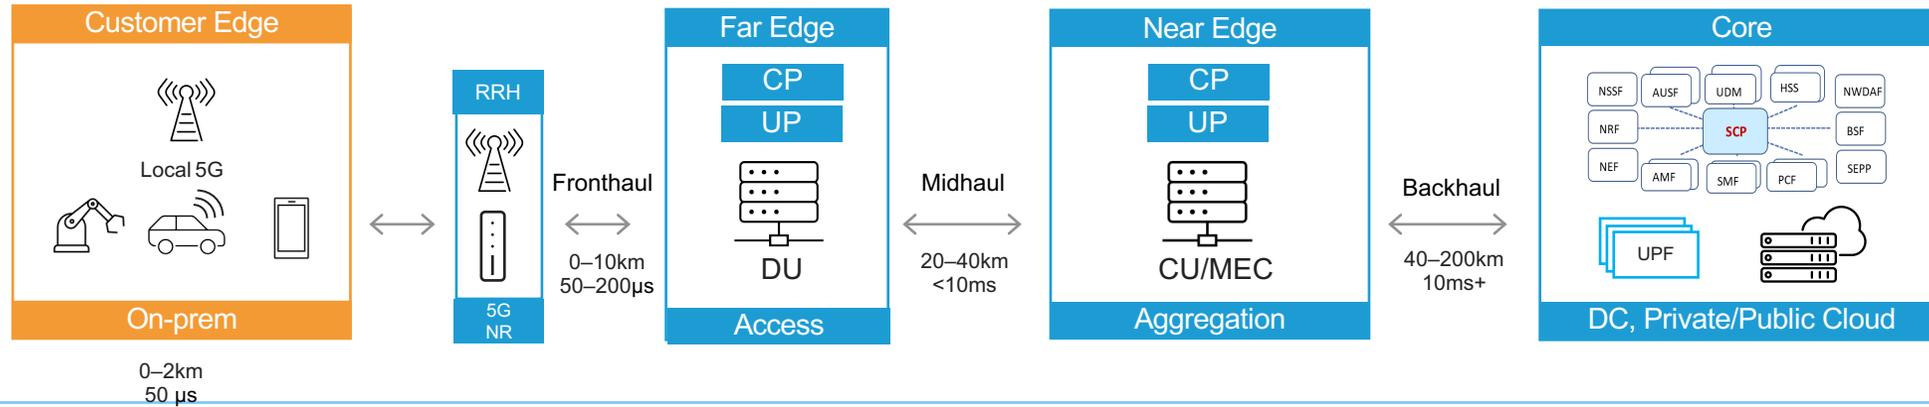

Different vendors bringing their container runtime layer

Mode 3

Separated Container infrastructure

Current Approaches were not built for this reality

↑ **7-15+ Vendor Components**

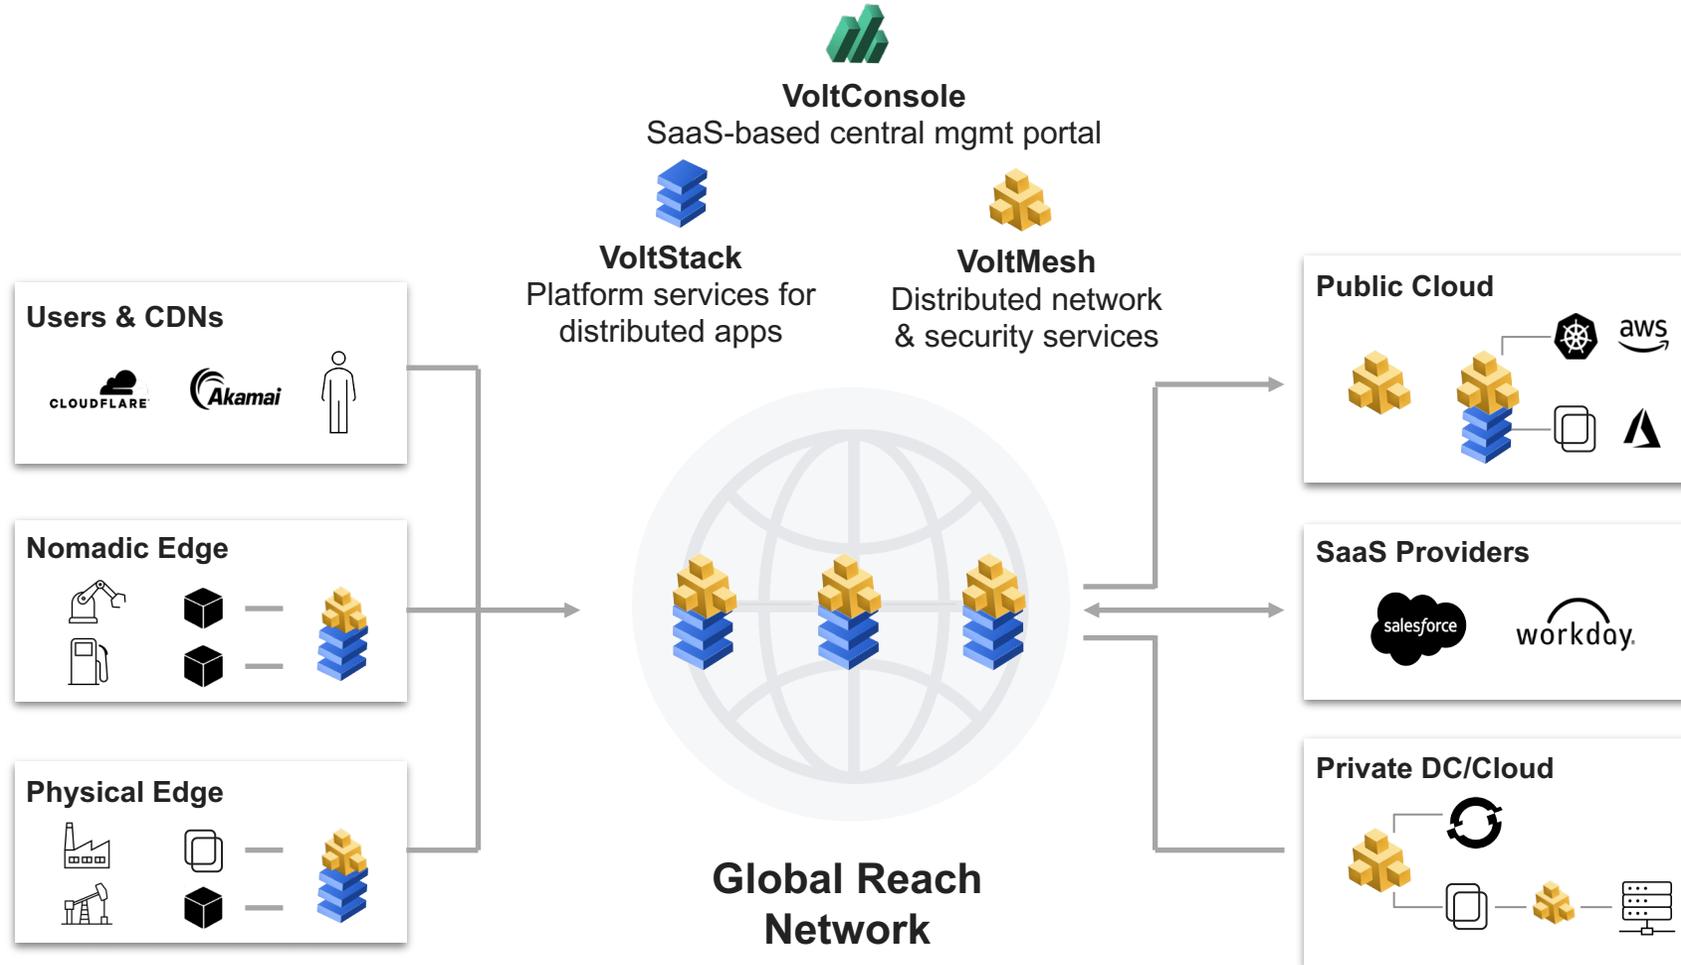

↑ **Silo'd Config Mgmt**

↑ **Policy + Observability**

Distributed Cloud Platform

Leveraging a Distributed Cloud Platform

Consolidated Service

Lower TCO and Complexity
